Introduction

Dunning - The word stems from the 17th-century verb dun, meaning to demand payment of a debt

Dunning identifies specific debt as outstanding or that is to be reclaimed due to payment refusal.

Dunning provides a toolset, aimed to expedite the recovery of the outstanding debt, the tools include various types of customer interactions or activities that entail service suppression.

Dunning is responsible to determine when outstanding debt needs to be tracked and managed and when the recovery process for that outstanding debt is done.

Dunning - Business Pillars

- **Dunning strategy** collectively defines the applicable dunning treatment, it defines the appropriate toolset of actions using which the system will attempt to reclaim the outstanding debt.
- **Dunning rule** defines when a given dunning instruction should be used for facilitating the dunning treatment.
- **Dunning case** represent the end-to-end life cycle of a specific dunning treatment from identification to closure.

Following table captures an example of a Dunning business illustrating various business events and dunning rules excuted and actions taken during a timeline captured in first column.

Time	Business Event	Business Rule	Business Action	Case Status
T1	$100 debt is past its due date by 5 days	Age > 5 days	Open a new dunning case & Send an email reminder.	Active
T2	$100 debt is past its due date by 12 days	Age > 12 days	Send notification indicating further action	Active
T3	$100 debt is past its due date by 20 days	Age > 20 days	Suspend the Product	Active
T4	Customer calls CSR and complains about some quality-of-service issue in past, CSR gives $7 **credit** for past issue. (Balance = $100 - $7credit = $93)	Credit Issues && Balance > 0	New amount due is communicated to the Customer via SMS and Email.	Active
T5	Customer makes payment of $93	Payment received && Balance = 0	Resume the Product & Close the case	Closed

Figure 1 Dunning Example

Following diagram illustrates the business flow of dunning and captures the lifecycle of a dunning case from inception to closure.

Use Cases

Administration of Dunning Strategy and Dunning Rules:

The Dunning Case API can be called by the dunning department of a company via e.g. an administrative tool, to create update or delete the dunning Strategy and the dunning rules, based on the dunning strategy of the company. Some examples:

- A new rule is created to trigger one more notification to the customer, e.g. after 10 days, via email, while the existing one is an SMS sent in 7 days
- A new rule is created, which is triggered when the customer opens a new trouble ticket
- An existing rule is updated, with a more aggressive action (e.g., call from an agent instead of SMS notification)
- A new Strategy is created, to cover the dunning process of a new customer segmentation (e.g. mid value customers, while the existing one cover the segments mass and high value)
- A Strategy is updated with extra rules
- A Strategy is updated as obsolete, due to special period (e.g. Covid-19 makes obsolete the “hard” strategy)
- The dunning strategy applicable to a specific customer account is updated in the system by an administrator for special reasons. This could be done by deploying specific Dunning Strategy with more relaxed rules and actions, and with conditions that match certain specific customers or types or customers.

Example:

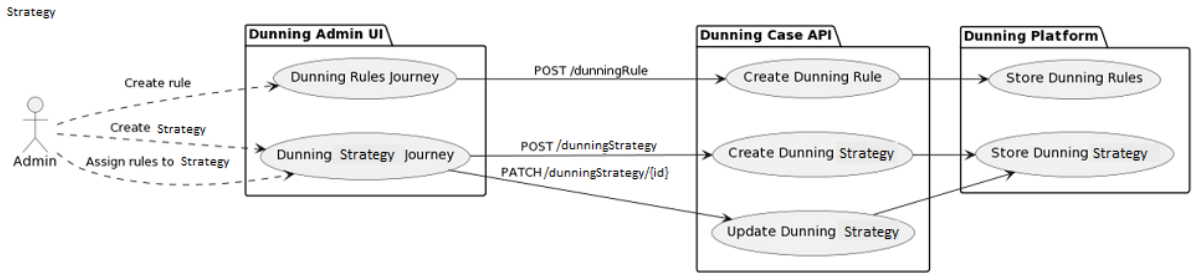

Figure 3. Administration of Dunning Strategy and Dunning Rules

Main actors:

- A Dunning administrator
- A dunning administrative user interface, with journeys of managing dunning rules and Strategy, using the Dunning Case API
- A platform capable of storing the Dunning Strategy and rules reference data

Use case steps:

1. The Dunning administrator creates a new dunning Strategy in line with business requirements, e.g. a Strategy to apply in high value customers;

© TM Forum 2026. All Rights Reserved.

2. The Dunning administrator creates one or more Dunning rules applicable to dunning strategy and apply them on the dunning Strategy, e.g. that customers of specific tariff plans and with debt above a specific amount are handled by the dunning Strategy; Part of the dunning rule creation are the following:
3. The Dunning administrator specifies the set of conditions applicable to each Dunning Rule, e.g. minimum debt = 50 euros and minimum time period passed 7 days;
4. The Dunning administrator specifies the type of dunning action that will take place, when the conditions of the dunning rules are met, e.g. send an SMS reminder or apply a penalty charge.

Dunning Strategy and rules are commonly created and configured in the Dunning Platform through the user interface or reference data, and not though external interfaces. Consequently, this operation would not be mandatory in the API.

Getting the list of Dunning Cases of a Customer:

Whenever a customer enters the dunning process, a dunning case is linked to their customer account debt and it contains all details pertaining to the debt, such as dunning case rules and interactions. Typically, these are the steps that are followed to get a dunning case's details for a customer.

1. A customer's outbound mobile calls have been barred on the network due to a lack of payment on their account despite several written warnings.
2. The customer calls the care team to complain and understand why his service has been curtailed.
3. The care agent logs into the Customer Information system.
4. The agent runs a query to fetch Dunning case details for a customer account number. This step will call the DunningCase GET operation.
5. The Debt and Collection Management system returns any active Dunning case details.
6. Depending on the information received in the response, the agent acts as per the dunning rules specified for the customer (Consumer or Enterprise).

A customer might have also be notified of the Dunning Case via postal mail or other notification media with the id or the URL to view the detail. The customer then:

1. Would open the URL of the notification or would log into his self-care portal app or web site.
2. Fetch his dunning case by id or run a query against this customer account number.
3. The Debt and Collection Management system returns any active Dunning case details.
4. Customer sees the detail of the Dunning Case and the options available for him to cancel the debt.

Example:

© TM Forum 2026. All Rights Reserved.

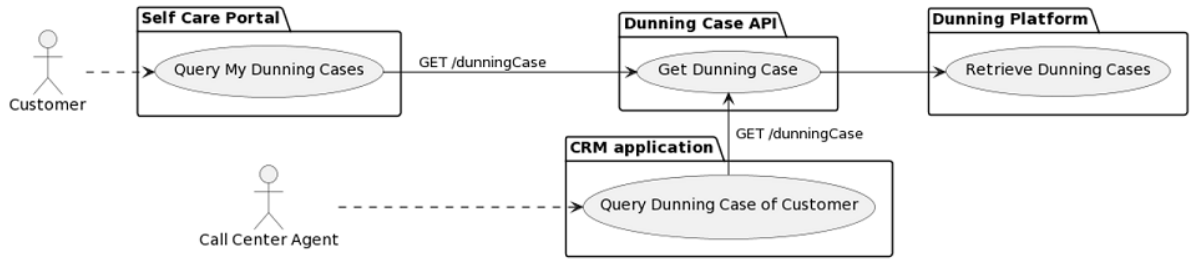

Figure 4. Getting the list of Dunning Cases of a Customer

Main actors:

- The customer
- The Self Care portal with journeys to show customer if he has any Dunning Case open.
- The CRM application, with a screen to query Dunning Cases of a customer.
- platform capable of storing the Dunning Cases.

Creating a Dunning Case on a Customer Billing Account:

Normally the Debt and Collection Management system is the system responsible for evaluation the Dunning Strategy and Creating the Dunning Cases:

1. Policy Events are triggered
2. System checks if Policy Conditions are met.
3. Corresponding Policy Actions are automated.

Each of the actions imply the automatic creation of a Dunning Case, in accordance to the Dunning Strategy.

The Collection Management system may however expose an administrative API to create Dunning Cases that are generated from other sources or applications, like for instance when a company has different IT stacks and need to communicate Dunning Cases from one stack to the other, or when there are different Debt and Collection Management systems, and one must communicate the Dunning Cases to the other.

Example:

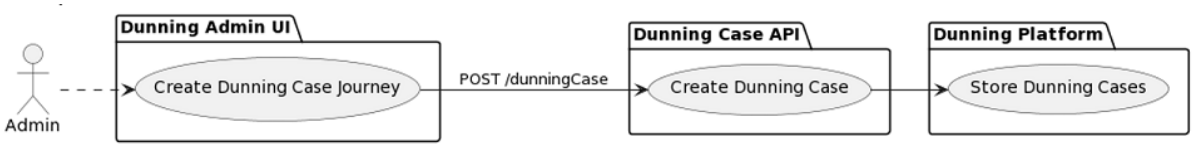

Figure 5. Creating a Dunning Case

Support of polymorphism and extension patterns

Support of polymorphic collections and types and schema based extension is provided by means of a list of generic meta-attributes that we describe below. Polymorphism in collections occurs when entities inherit from base entities, for instance DunningActionNotification and DunningActionProductOrder inheriting properties from the abstract DunningActionEntity.

Generic support of polymorphism and pattern extensions is described in the TMF API Guidelines.

The @type attribute provides a way to represent the actual class type of an entity. For example, A DunningActionEntity instance might be an instances of DunningActionNotification or DunningActionProductOrder or DunningActionCustomerBill. The @type gives this information. All resources and sub-resources of this API have a @type attributes that can be provided when this is useful.

The @schemaLocation property can be used in resources to allow specifying user-defined properties of an Entity or to specify the expected characteristics of an entity.

The @baseType attribute gives a way to provide explicitly the base class of a given resource that has been extended.

RESOURCE MODEL

Managed Entity and Task Resource Models

DunningRule resource

Represents rule definitions applicable for dunning case: the events that trigger dunning rules evaluation, the conditions to evaluate and the actions that must be done.

Resource model

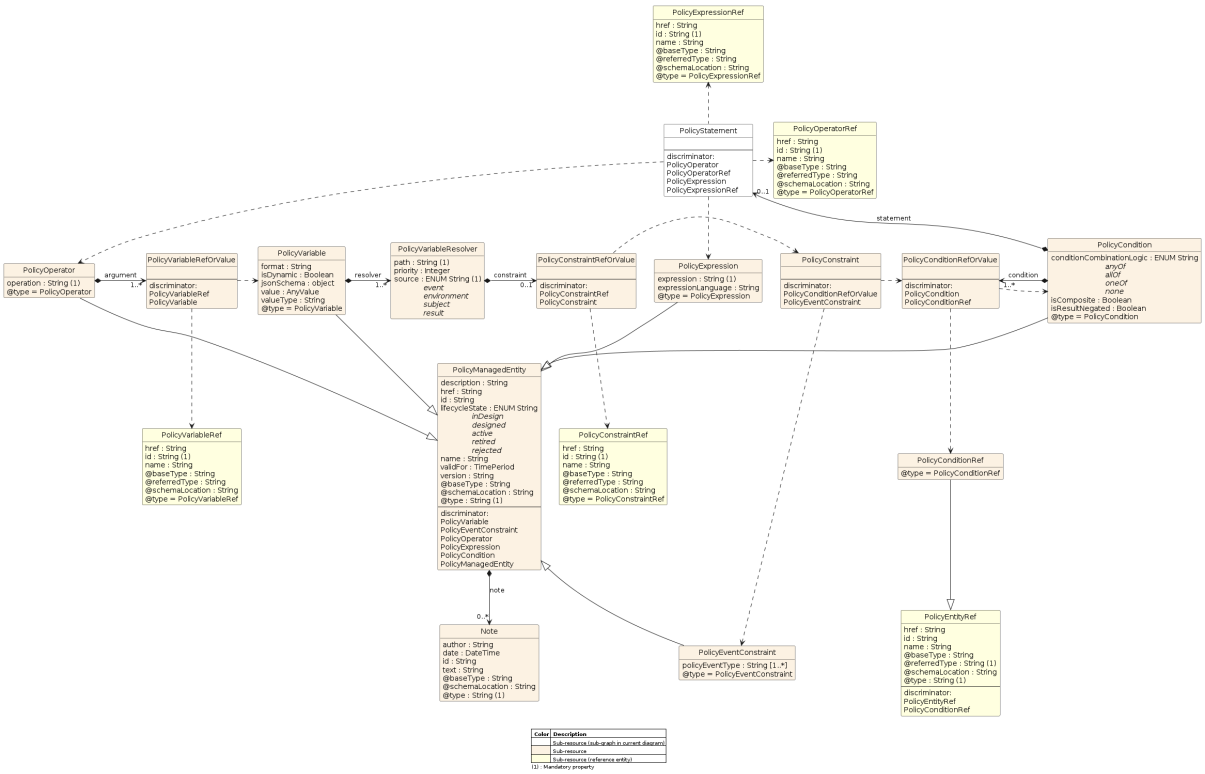

Figure 2 - PolicyStatement

Field descriptions

DunningRule fields

dunningAction	A DunningRuleActionType. The action to be executed when the dunningEvent occurs if the dunning condition evaluates to true. ENUMERATED with values: * notification * fee * productOrder * customerBill * writeOff
dunningCondition	A PolicyCondition. A PolicyCondition clause is a collection of individual policy conditions, treated as a single unit that is combined with a PolicyRule. It is expressed as a Boolean (true or false) statement, defining the required state and/or prerequisites that determine whether the actions specified by that same PolicyRule should be carried out. If the PolicyCondition is evaluated successfully, it must result in either a TRUE or FALSE value. However, if the evaluation is unsuccessful, it will not contain any Boolean value.

© TM Forum 2026. All Rights Reserved.

dunningEvent	A DunningRuleEventType. An Enumeration string describing the business event that can impact the dunning flow. ENUMERATED with values: * paymentRejected * paymentReceived * paymentBackout * newRevenue * credit * creditReversal * refund * refundReversal * writeOff * fundsTransfer * aging * addPaymentArrangement * removePaymentArrangement
href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the dunning rule.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

PolicyCondition sub-resource fields

See [PolicyCondition] for details.

PolicyCondition sub-resource fields

condition	A PolicyConditionRefOrValue. Array of atomic PolicyConditions. Composite only.Mandatory for composite.
conditionCombinationLogic	A String. Composite only. Mandatory for composite. Following combination logic is applied: * anyOf - if ANY condition resolves to TRUE, end result is TRUE * allOf - if ALL conditions resolves to TRUE, end result is TRUE * oneOf - if exactly ONE condition resolves to TRUE, end result is TRUE * none - if NONE condition resolves to TRUE, end result is TRUE. ENUMERATED with values: * anyOf * allOf * oneOf * none
description	A String. Description of the Policy Entity.
href	A String. Hyperlink reference.
id	A String. Unique identifier.

© TM Forum 2026. All Rights Reserved.

isComposite	A Boolean. If true, this PolicyCondition is a composite condition. If false, this PolicyCondition is an atomic condition.
isResultNegated	A Boolean. If true, the result of this PolicyCondition is negated. If false, the result of this PolicyCondition is not modified.
lifecycleState	A String. Lifecycle state of the Policy Entity. ENUMERATED with values: * inDesign * designed * active * retired * rejected
name	A String. Name of the Policy Entity.
note	A Note. Comments related to Policy Entity.
statement	A PolicyStatement. PolicyStatement is a definition of a: * query statement that resolves to boolean value or * command statement that is changing a value.
validFor	A TimePeriod. A period of time, either as a deadline (endDateTime only) a startDateTime only, or both.
version	A String. Version of the Policy Entity.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String.

Note sub-resource fields

author	A String. Author of the note.
date	A DateTime. Date of the note.
id	A String. Identifier of the note within its containing entity.
text	A String. Text of the note.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

PolicyExpression sub-resource fields

description	A String. Description of the Policy Entity.
expression	A String. Expression language command.
expressionLanguage	A String. Defines expression language used to build expression.
href	A String. Hyperlink reference.

© TM Forum 2026. All Rights Reserved.

id	A String. Unique identifier.
lifecycleState	A String. Lifecycle state of the Policy Entity. ENUMERATED with values: * inDesign * designed * active * retired * rejected
name	A String. Name of the Policy Entity.
note	A Note. Comments related to Policy Entity.
validFor	A TimePeriod. A period of time, either as a deadline (endDateTime only) a startDateTime only, or both.
version	A String. Version of the Policy Entity.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String.

PolicyExpressionRef sub-resource fields

href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the referred entity.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

PolicyOperator sub-resource fields

argument	A PolicyVariableRefOrValue. List of operation arguments.
description	A String. Description of the Policy Entity.
href	A String. Hyperlink reference.
id	A String. Unique identifier.

© TM Forum 2026. All Rights Reserved.

lifecycleState	A String. Lifecycle state of the Policy Entity. ENUMERATED with values: * inDesign * designed * active * retired * rejected
name	A String. Name of the Policy Entity.
note	A Note. Comments related to Policy Entity.
operation	A String. Name of the operation, like greaterThan, exists, addItemToArray, multiply, …
validFor	A TimePeriod. A period of time, either as a deadline (endDateTime only) a startDateTime only, or both.
version	A String. Version of the Policy Entity.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

PolicyVariable sub-resource fields

description	A String. Description of the Policy Entity.
format	A String. Additional description of a value type, like date, date-time, …
href	A String. Hyperlink reference.
id	A String. Unique identifier.
isDynamic	A Boolean. Flag to determine is PolicyVariable static or dynamic. Default value is false.
jsonSchema	An object. Optional JSON Schema of a value. It is used to provide additional information related to value.
lifecycleState	A String. Lifecycle state of the Policy Entity. ENUMERATED with values: * inDesign * designed * active * retired * rejected
name	A String. Name of the Policy Entity.
note	A Note. Comments related to Policy Entity.
resolver	A PolicyVariableResolver. Definition of a variable resolver. Required for dynamic variables. Forbidden for static variables.
validFor	A TimePeriod. A period of time, either as a deadline (endDateTime only) a startDateTime only, or both.

© TM Forum 2026. All Rights Reserved.

value	An AnyValue.
valueType	A String. Value type of a variable, like string, boolean, number, integer, object, array.
version	A String. Version of the Policy Entity.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. Polymorphic type of a PolicyVariable.

PolicyVariableResolver sub-resource fields

constraint	A PolicyConstraintRefOrValue. The polymorphic attributes @type, @schemaLocation & @referredType are related to the PolicyConstraint entity and not the PolicyConstraintRefOrValue class itself.
path	A String. JSONPath of a variable.
priority	An Integer. Sequence value when PolicyVariableResolver has to be executed in a specific order. Higher value means greater priority. Priority is not absolute, but relative in hierarchy.
source	A String. Source from which variable is being resolved. One of: * event - triggered event is variable source * environment - environment store is variable source * subject - subject data is variable source * result - result storage is variable source. ENUMERATED with values: * event * environment * subject * result

PolicyConstraintRef sub-resource fields

href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the referred entity.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

PolicyVariableRef sub-resource fields

href	A String. Hyperlink reference.

© TM Forum 2026. All Rights Reserved.

id	A String. Unique identifier.
name	A String. Name of the referred entity.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

PolicyOperatorRef sub-resource fields

href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the referred entity.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

PolicyConditionRef sub-resource fields

href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the referred entity.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String.

Note sub-resource fields

See [Note] for details.

PolicyExpression sub-resource fields

DunningStrategy resource

Describes company strategy to be applied for different dunning situations. It must be easily configurable to describe the dunning rules to apply to a case, the order in which to apply them, the events that trigger dunning rules evaluation and the actions that must be taken.

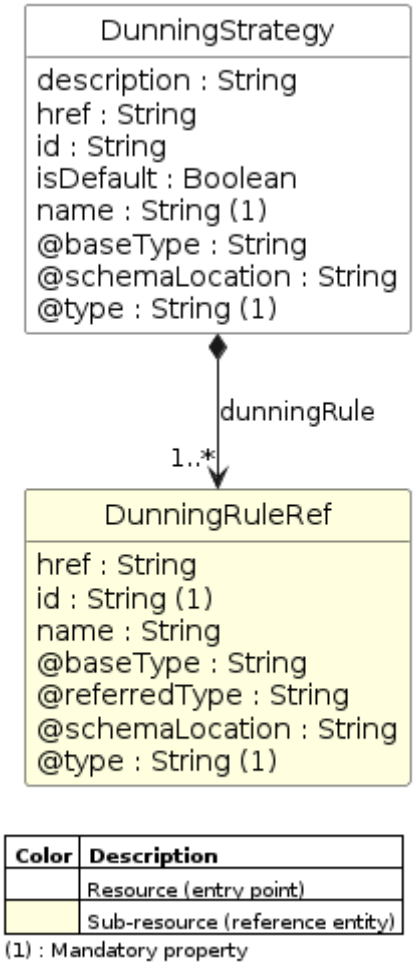

Figure 3 - DunningStrategy

Field descriptions

DunningStrategy fields

description	A String. A detailed description of the dunning strategy.
dunningRule	A DunningRuleRef. Dunning rule reference.
href	A String. Hyperlink reference.
id	A String. Unique identifier.
isDefault	A Boolean. If true, indicates that the DunningStrategy is the one to use by default if no specific DunningStrategy is specified for the CustomerAccount, validation to make sure only one strategy is defined as default should be implemented programatically.
name	A String. A word or phrase by which a dunning strategy is known and distinguished from other dunning strategy such as residentials or low risk.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.

© TM Forum 2026. All Rights Reserved.

@type	A String. When sub-classing, this defines the sub-class Extensible name.

DunningRuleRef sub-resource fields

href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the referred entity.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

DunningCase resource

The DunningCase represents full dunning lifecyle. When a customer enters the dunning process, a dunning case is linked to their customer account debt and it contains all details pertaining to the debt, such as applied dunning rules, interactions. The status of a dunning case evolves according to internal or external events (payments made by the customer, payment schedule granted, etc.).

Field descriptions

DunningCase fields

appliedDunningRule	An AppliedDunningRule. Dunning Rules that were applied to the Dunning case.
billingAccount	A BillingAccountRef. BillingAccount reference. A BillingAccount is a detailed description of a bill structure.
creationDate	A DateTime. The date and time on which the dunning case was created.
description	A String. A detailed description of the dunning case.
dunningStrategy	A DunningStrategyRef. A dunning strategy reference.
finalBalance	An AccountBalance. Balances linked to the account.
href	A String. Hyperlink reference.
id	A String. Unique identifier.
initialBalance	An AccountBalance. Balances linked to the account.
lastActivityDate	A DateTime. The date and time that the dunning case had its latest activity.
lastUpdate	A DateTime. The date and time that the dunning case was last updated.
status	A String. The current status of the dunning case.

© TM Forum 2026. All Rights Reserved.

validFor	A TimePeriod. A period of time, either as a deadline (endDateTime only) a startDateTime only, or both.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

AppliedDunningRule sub-resource fields

creationDate	A DateTime. The date on which the dunning rule was applied.
dunningActionEntity	A DunningActionEntity. Represents reference to the entity related to the action performed as a result of dunning rule execution. DunningActionEntity can be instantiated as * DunningActionCustomerBill * DunningActionFee * DunningActionNotification * DunningActionProductOrder
dunningRule	A DunningRuleRef. Dunning rule reference.
id	A String. Unique identifier for the dunning case rule.
name	A String. Name of the dunning rule.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

DunningActionEntity sub-resource fields

dunningAction	A String. The dunning action performed as a result of dunning rule execution.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.
	DunningActionEntity can be instantiated as * DunningActionCustomerBill * DunningActionFee * DunningActionNotification * DunningActionProductOrder
dunningCustomerBill	This property is present in subclasses
dunningFee	This property is present in subclasses

© TM Forum 2026. All Rights Reserved.

dunningNotification	This property is present in subclasses
dunningProductOrder	This property is present in subclasses
partyInteractionInfo	This property is present in subclasses
productOrderInfo	This property is present in subclasses
taxIncludedAmount	This property is present in subclasses

CustomerBillRef sub-resource fields

href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the referred entity.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

AppliedCustomerBillingRateRef sub-resource fields

href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the referred entity.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

PartyInteractionRef sub-resource fields

href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the referred entity.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.

© TM Forum 2026. All Rights Reserved.

@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

ProductOrderRef sub-resource fields

href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the referred entity.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

DunningActionCustomerBill sub-resource fields

dunningAction	A String. The dunning action performed as a result of dunning rule execution.
dunningCustomerBill	A CustomerBillRef. Reference to the closing CustomerBill.
taxIncludedAmount	A Money. A base / value business entity used to represent money.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

DunningActionFee sub-resource fields

dunningAction	A String. The dunning action performed as a result of dunning rule execution.
dunningFee	An AppliedCustomerBillingRateRef. Reference to a AppliedCustomerBillingRate which captures Fee/penalty charge such as late fee, payment rejection fee, interest, associated with the dunning action taken according to contractual terms and conditions.
taxIncludedAmount	A Money. A base / value business entity used to represent money.
@baseType	A String. When sub-classing, this defines the super-class.

© TM Forum 2026. All Rights Reserved.

@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

DunningActionNotification sub-resource fields

dunningAction	A String. The dunning action performed as a result of dunning rule execution.
dunningNotification	A PartyInteractionRef. A communication or joint activity from the Telecommunication Operator to the customer to ask for a CustomerPayment or negotiate a PaymentPlan.
partyInteractionInfo	A String. Some information regarding the interactions initiated as a result of dunning rule execution.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

DunningActionProductOrder sub-resource fields

dunningAction	A String. The dunning action performed as a result of dunning rule execution.
dunningProductOrder	A ProductOrderRef. Represents reference to the ProductOrder that captures any product configuration change that applies the Dunning sanction.
productOrderInfo	A String. Information regarding the product order created as a result of dunning rule execution. A Short Business description of what the product order is actually expected to do.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

DunningRuleRef sub-resource fields

See [DunningRuleRef] for details.

BillingAccountRef sub-resource fields

href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the referred entity.

© TM Forum 2026. All Rights Reserved.

ratingType	A String. Indicates whether the account follows a specific payment option such as prepaid or postpaid.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

DunningStrategyRef sub-resource fields

href	A String. Hyperlink reference.
id	A String. Unique identifier.
name	A String. Name of the referred entity.
@baseType	A String. When sub-classing, this defines the super-class.
@referredType	A String. The actual type of the target instance when needed for disambiguation.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

AccountBalance sub-resource fields

amount	A Money. A base / value business entity used to represent money.
balanceType	A String. Type of the balance : deposit balance, disputed balance, loyalty balance, receivable balance…
id	A String. Identifier of the balance within list of the balances (for entities with list).
validFor	A TimePeriod. A period of time, either as a deadline (endDateTime only) a startDateTime only, or both.
@baseType	A String. When sub-classing, this defines the super-class.
@schemaLocation	A String. A URI to a JSON-Schema file that defines additional attributes and relationships.
@type	A String. When sub-classing, this defines the sub-class Extensible name.

AccountBalance sub-resource fields

See [AccountBalance] for details.

Notification Resource Models

10 notifications are defined for this API.

© TM Forum 2026. All Rights Reserved.

Notifications related to DunningRule:

- Create Event
- Delete Event
- Attribute Value Change Event

Notifications related to DunningStrategy:

- Create Event
- Delete Event
- Attribute Value Change Event

Notifications related to DunningCase:

- Create Event
- Delete Event
- Attribute Value Change Event
- Status Change Event

The notification structure for all notifications in this API follow the pattern depicted by the figure below. A notification event resource (depicted by "SpecificEvent" placeholder) is a sub class of a generic Event structure containing at least an id of the event occurrence (eventId), an event timestamp (eventTime), and the name of the resource (eventType). This notification structure owns an event payload structure ("SpecificEventPayload" placeholder) linked to the resource concerned by the notification using the resource name as access field ("resourceName" placeholder).

API OPERATIONS

Every operation consists of two parts:

- REQUEST: Publish a message on a 'commandRequest' channel.
- RESPONSE: Subscribe to the corresponding 'commandReply' channel to receive the response.

Remember the following Async Uniform Contract:

Operation on Entities	Uniform Async API Operation	Description
Query One Entity	retrieveResource	retrieve must be used to retrieve a representation of a resource.
Query Entities	listResource	list must be used to retrieve a list of resources.
Create Entity	createResource	create must be used to create a new resource
Partial Update of an Entity	patchResource	patch must be used to partially update a resource
Remove an Entity	deleteResource	delete must be used to remove a resource

Filtering and attribute selection rules are described in the TMF Async Design Guidelines.

Notifications are also described in a subsequent section.

Operations on DunningRule

Retrieves a DunningRule by ID

`GET /dunningRule/{id}?fields=…`

Description

This operation retrieves a DunningRule entity. Attribute selection is enabled for all first level attributes. Filtering may be available depending on the compliance level supported by an implementation.

Usage samples

DunningRule retrieve example

Request

```
GET /dunningRule/dunningRule123
Content-Type: application/json
```

Response

Updates partially a DunningRule

PATCH /dunningRule/{id}?fields=…

Description

This operation allows partial updates of a DunningRule entity. Support of json/merge (https://tools.ietf.org/html/rfc7396) is mandatory, support of json/patch (http://tools.ietf.org/html/rfc5789) is optional. Note: If the update operation yields to the creation of sub-resources or relationships, the same rules concerning mandatory sub-resource attributes and default value settings in the POST operation applies to the PATCH operation. Hence these tables are not repeated here.

Patchable and Non Patchable Attributes

Non Patchable Attributes	Rule
href	
id	
@baseType	@baseType is immutable
@schemaLocation	@schemaLocation is immutable
@type	@type is immutable

Patchable Attributes	Rule
dunningAction	
dunningCondition	
dunningEvent	
name	

Usage samples

DunningRule partialupdate example application json

Deletes a DunningRule

`DELETE /dunningRule/{id}`

Description

This operation deletes a DunningRule entity.

Usage samples

Dunning Rule delete example

Request

```
DELETE /dunningRule/dunningRule123
Content-Type: application/json
```

Response

```
204
```

Operations on DunningStrategy

Retrieves a DunningStrategy by ID

`GET /dunningStrategy/{id}?fields=…`

Description

This operation retrieves a DunningStrategy entity. Attribute selection is enabled for all first level attributes. Filtering may be available depending on the compliance level supported by an implementation.

Usage samples

Updates partially a DunningStrategy

`PATCH /dunningStrategy/{id}?fields=…`

Description

This operation allows partial updates of a DunningStrategy entity. Support of json/merge (https://tools.ietf.org/html/rfc7396) is mandatory, support of json/patch (http://tools.ietf.org/html/rfc5789) is optional. Note: If the update operation yields to the creation of sub-resources or relationships, the same rules concerning mandatory sub-resource attributes and default value settings in the POST operation applies to the PATCH operation. Hence these tables are not repeated here.

Updates partially a DunningCase

`PATCH /dunningCase/{id}?fields=…`

Description

This operation allows partial updates of a DunningCase entity. Support of json/merge (https://tools.ietf.org/html/rfc7396) is mandatory, support of json/patch (http://tools.ietf.org/html/rfc5789) is optional. Note: If the update operation yields to the creation of sub-resources or relationships, the same rules concerning mandatory sub-resource attributes and default value settings in the POST operation applies to the PATCH operation. Hence these tables are not repeated here.

Patchable and Non Patchable Attributes

Non Patchable Attributes	Rule

```

Deletes a DunningCase

`DELETE /dunningCase/{id}`

Description

This operation deletes a DunningCase entity.

Usage samples

Dunning Case delete example

Request

```
DELETE /dunningCase/dunningCase123
Content-Type: application/json
```

Response

```
204
```

NOTIFICATIONS

Topic for DunningCase entity: {prefix}.dunning.v5.dunningCase.notificationEvent

Topic for DunningRule entity: {prefix}.dunning.v5.dunningRule.notificationEvent

Topic for DunningStrategy entity: {prefix}.dunning.v5.dunningStrategy.notificationEvent

For every single of operation on the entities use the following templates and provide sample notification message payloads.

It is assumed that consumers will subscribe to the notificationEvent channel to receive notifications, and that the server component will post notifications to that channel.

Publish Event to listener

Here's an example of a notification received by the consumer. In this example "EVENT TYPE" should be replaced by one of the notification types supported by this API (see Notification resources Models section) and EVENT BODY refers to the data structure of the given notification type.

{ "event": { EVENT BODY }, "eventType": "EVENT_TYPE" }

For detailed examples on the general TM Forum notification mechanism, see the TMF Async Design Guidelines.
